The Single Flute Chamfer Hogs

CHA90-1 SHOWN FULL SIZE

This cutter was developed in 1982 for spot drilling and chamfer milling small slots in non-ferrous part materials. If used prior to drilling in non-ferrous materials it performs well. If used as a countersink after the hole is drilled it is chatter prone.

It is not for use as a rotating cutter in ferrous materials since the (25°) relief angle is too weak. However, in the more rigid lathe environment it can be used successfully to spot drill holes in ferrous materials. We spot drill our Accu-Holds (4340) in CNC lathes at 900 RPM and .0005 IPR, with tool life of 200 holes per insert corner.

It should never be used in a drill press.

All five cutters have 3/4 shanks and are 5" overall.

All Single Flute Chamfer-Hogs, including inserts, are **\$190.** ea.

* Note: CHA60-1 is **not** center cut; it has .200 end cut diameter.

The CL-4 Clamps are **\$15.** each, includes screw.

The 10-32 Socket Head Cap Screw is Industry Standard.

TFG-322 and TD-6P are Industry Standard Inserts modified with a secondary facet near the point to prevent "heeling".

SAW ARBORS for Carbide or HSS Saws with key drives for 5/8 and larger arbors

Saws thinner than .050 must not rest on the shoulder. Either on one spacer or several.

HUB ϕ , the outside diameter of the Shoulder, Hex Nut and the spacers.

Precise, for the thinnest saws.
High Torque for Keyless saws.
Rugged, with key drives.

Hardened Alloy Steel, precision ground, Black Oxide coated.

Shim Style spacers in sets from .001 thru .015 are available from your Industrial Distributor.

The spacer assortments will accommodate most saws and spacers that will fit in the L-1 Length.
*Spacers ordered with Keyed Arbors will also have keyways.

Speed/Feed Formulas, and Shank Flat Data

SFM = RPM X .262 X Tool Diameter
 RPM = SFM X 3.82 / Tool Diameter
 IPM = RPM X IPT X Number of Flutes

IPT = IPM / (RPM X Number of Flutes)
 CIM = Width X Depth X IPM
 HP = KW X 1.341

Comparative Estimates of CIM per HP for various part materials, (using carbide);
 Cold Rolled Steel (1018)..... 1 CIM per HP
 Aluminum, Magnesium, Plastics, Graphite..... 4 to 6 CIM per HP
 Cast Iron, 303..... .7 to .8 CIM per HP
 Tool Steel, Alloy Steel, 304-316, 17-4PH, 6AL-4V.. .4 to .6 CIM per HP
 Inconel and other High Temperature Alloys..... .2 to .4 CIM per HP

Suggested SFM and IPT are shown in *Italics* on each page with each Cutter Style.

Aluminum Milling Tests

Faster CIM metal removal rates in aluminum depend more on IPM feed rates, horsepower and the cutter geometry than RPM.

You'll get higher CIM with smaller cutters, (assuming you're rough milling with cutters about one inch in diameter and larger). On tests 5, 6 and 8, with full diameter cuts, the one inch gets 46 CIM, the 1-1/4 gets 42 CIM and the two inch gets 37 CIM.

You'll get higher CIM with a cut width that is about 3/4 of the cutter diameter than with a full diameter cut width, (a long accepted machinist's rule).

Compare Tests 1 versus 3 and 6 versus 7. You can get the same CIM with fewer flutes, plus reduced insert costs; see Test 8.

See inside back cover for SH750 along with back cover for all shank style Shear-Hogs.
